No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RESULT 8
B47159
Igheavy chain V region, anti-carcinoembryonic maid T84.66 antigen monoclonal anti-id C; Species: Mus musculus (house mouse)
C; Date: 21-Sep-1993 #sequence_revision 18-Nov-1994 #text_change 16-Aug-1996
C; Date: 21-Sep-1993 #sequence_revision 18-Nov-1994 #text_change 16-Aug-1996
C; Date: 21-Sep-1993 #sequence_revision 18-Nov-1994 #text_change 16-Aug-1996
C; Accession: B47159
R; Gaida, F.J.; Pleper, D.; Roder, U.W.; Shively, J.E.; Wagener, C.; Neumaier, M. J. Biol. Chem. 268, 14138-14145, 1993
A; Title: Molecular characterization of a cloned idiotypic cascade containing a networ A; Reference number: A47159; MUID:93300804
A; Reference number: A47159; MUID:93300804
A; Status: preliminary
A; Molecular type: DNA; protein
A; Residues: 1-136 cGAI>
A; Experimental source: hybridoma 6G6.C4
A; Note: sequence inconsistent with the nucleotide translation
A; Note: sequence extracted from NCBI backbone (NCBIN:134421, NCBIP:134422)
C; Superfamily: immunoglobulin V region; immunoglobulin homology
C; Keywords: heterotetramer; immunoglobulin
F; 34-117/Domain: immunoglobulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ig heavy chain precursor V region (543) - mouse C:Species: Mus musculus (house mouse) C:Species: Mus musculus (house mouse) C:Date: 02-Apr-1982 #text_change 22-Jun-1999 C:Accession: A02038 #sequence_revision 02-Apr-1982 #text_change 22-Jun-1999 C:Accession: A02038 R:Bothwell, A.L.M.; Paskind, M.; Reth, M.; Imanishi-Kari, T.; Rajewsky, K.; Baltimore Cell 24, 625-637, 1981 A:Title: Heavy chain variable region contribution to the NP(b) family of antibodies: A:Accession: A02038

 The present sequence represents the heavy chain varaible region of murine antibody Act-1. Act-1 is active against human alpha4-betta7 integrin. Muscosal adressin cell adhesion molecule-1 (MadCAM-1) is a ligand of th.s particular integrin. The Act-1 antibody inteferes with alpha4-beta7 integrin binding to MadCAM-1, which is present of high endothelial venules in mucosal lymph nodes. Humanised Act-1 can be used to inhibit the interaction of cells bearing alpha4-beta7 with cells bearing a light of crapha4-beta7. It can be used for inhibiting diseases such as inflammatory bowel diseases. The immunoglobulin can also be used for detection, isolation and diagnosis.

 The present sequence represents the amino acid sequence comprising the variable region of murine Act-1 antibody determined from clone H2B#34. Act-1 is active against human alpha4-beta7 integrin. Muscosal adressin call adhesion molecule-1 (MadCAM-1) is a ligand of this particular integrin. The Act-1 antibody inteferes with alpha4-beta7 integrin binding to MadCAM-1, which is present of high endothelial venules in mucosal lymph nodes. The present sequence was used to construct chimeric. The humanised Act-1 antibodies, which contain murine antigen binding regions. The humanised immunoglobulin can be used to inhibit the interaction of calls bearing alpha4-beta7 with cells bearing a ligand for alpha4-beta7. It can be used for inhibiting leukocyte infiltration of tissues, e.g. for treating inflammatory diseases such as inflammatory bowel disease. The immunoglobulin can also be used for detection, isolation and diagnosis.

The present sequence tepresents the Conscissor acts sequence.

Comprising the variable region of murine Act-1 antibody determined from several independent mouse heavy chain variable region clones. Act-1 is active against human alpha+ beta7 integrin. Muscosal adressin cell adhesion molecule-1 (MadcAm-1) is a ligand of this particular integrin. The Act-1 antibody inteferes with alpha+ beta7 integrin binding to MadCAm-1, which is present of high endothelial venules in mucosal by machine and sequence. The present sequence consensus sequence. The present sequence was used to construct chamanised Act-1 antibodies, which contain murine antigen binding regions. The humanised immunoglobulin can be used to inhibit the interaction of cells bearing alpha+ beta7 with cells bearing a construct contain of tissues, e.g. for treating inflammatory diseases such as inflammatory bowel diseases. The immunoglobulin can also be used for alpha+ beta7. It can be used for inhibiting leukocyte as inflammatory bowel diseases. The immunoglobulin can also be used for an animal and the immunoglobulin can also be used for an animal anim

This is the amino acid of the heavy chain of murine anti-human Fass monoclonal antibody HFE7A. CDNA (see V70129) encoding the heavy chain was obtained from HFE7A-secreting hybridoma (FERM BP-5828).

CRNA by RT-PCR (see V70125-26). The invention provides humanised HFE7A antibodies (see W83031-37) produced by CDR grafting. These antibodies are capable of inducing apoptosis in abnormal cells. Capressing Fas, and of inhibiting Fas-induced apoptosis in normal cells. They are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus cauch diseases, Hashimoto's disease, graft versus host disease, Sjogren syndrome, pernicious anaemia, Addison's disease, calcroderma, Goodpasture syndrome, Crohn's disease, rheumatoid gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin dependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, dimerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).
 Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; murine; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; heavy chain.

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs. (Complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allery, atopy, arteriosclerosis, myocarditis, cardiomyopathy, allery, atopy, arteriosclerosis, myocarditis, cardiomyopathy, allower longing graft rejection. The present sequence represents the heavy chain of the murine anti-human Fas monoclonal antibody HFETA,

This sequence represents a novel single chain antigen hybrid receptor (HR) and contains an extracellular domain specific for the hapten 4-hydroxy-5-iodo-3-nitrophenyl accetate (NRP) coupled to the CD8-alpha region and the transmembrane and signal-conducting intracellular parts of the CD3-zeta molecule. Such hybrid receptors comprise a receptor part olcalised on the outside of the cell and specific to a particular signal molecule and a receptor part originating from another receptor, localised on the inside of the cell and capable of setting off a signal inside the cell. The cell should also contain at least one other gene construct with a control region which can interact with the signal sent out by the hybrid receptor and thereby control expression of a transgene bound to this control region. Such cells are useful in gene therapy or for

 The patentors claim a chimeric antibody molecule comprising 2 light chains and 2 heavy chains, each comprising a constant human region and a variable non-human region. Coding sequences for the Ig chains are also claimed. The invention provides consensus sequences of light and heavy chain J regions useful in the design of oligonuclectides (UIGs) for use as primers or probes for cloning immunoglobulinlight or heavy chain manns or genes. Depending on the nature of design of a particular UIG, it may be capable of hybridizing to all Ig mRNAs or genes containing a single specific J sequence. UIG denotes universal immunoglobulin gene.
 Sequence encoded by anti-hepatitis B heavy chain variable region in pING2006E.
to
 recombinant
 ő
 to cancer
Donor splice sites were recreated in the 3' flanking regions tallow correct splicing of the variable and constant regions. 5' sequence was altered to introduce an initiation codon. The cloned antibody may be used int the prodn.of reshaped or humanised antibodies which are less immunogenic than native antibodies and may be used to combat e.g. glioma, melanoma or carcinoma.

This sequence represents a fragment of the human-mouse chimeric anti-hepatitis heavy chain encoded by the gene contained within processors. PinG2006E. WinG2006E. PinG2006E was used in the method of the invention to express the chimeric heavy chain. The method of the invention to express the chimeric heavy chain. The method of the invention of a protein in a Gram-negative bacterium. The method improves on current techniques, by using a vector including DNA encoding the pectate lyase signal sequence (see T51034), attached to the sequence encoding the protein for production. The method is especially used to make immunoglobulins (Ig), particularly those with a human constant region, suitable for passive immunosation (without risk of serum sickness or anaphylaxis) or for in vivo/in vitro diagnosis and imaging. The ignay also be used therapeutically, optionally coupled to toxins, etc.

Alternatively the protein to be produced is the sweetener thaumatin. The presence of this signal sequence means that the protein is exported from the cytoplasm and can be recovered from the culture medium or periplasm, and can be recovered from the culture medium or periplasm, and can be except human-human ig are of M class, easily creduced and aggregated, and these can now be changed to G, A or E

The present sequence was used in the development of a novel method-
for the production of an immunoglobulin (Ig) fragment capable of
binding an antigen. The method comprises culturing an E. Coli host
that has been transformed with a nucleic acid molecule encoding the
influence of the nucleic acid molecule comprises DNA sequences
encoding: (a) pectate lyase secretion signal sequence
influence of DNA sequence encoding at least the variable region of
influence of the influence of the comprises of the variable region of an Ig light chain, where (a) and (b) are operably linked
to a single profazior promoter to form a dicistronic
cranscription unit. The method is used to produce chimeric Fab
molecules, e.g. derived from murine monoclonal antibody L6 raised
against human lung carcinoma cells. The invention provides a novel
approach for producing genetically engineered antibodies of
desired variable region specificity and constant region
ceptical gene synthesis, recombinant DNA cloning and production of
specific Ig chains in various organisms. The application of
chemical gene synthesis, recombinant DNA cloning and production of
solution for the efficient large scale production of human
monoclonal antibodies. The invention also provides a solution to
the problem of class switching antibody molecules.
 {\tt DNA} encoding secretable immunoglobulin fragments - comprising at least the variable regions of light or heavy chains
 Robinson RR;
 Liu AY,
